

RMIT Building 55 Phase 1

Project: RMIT Building 55 Phase 1

Client: RMIT

Location: Melbourne CBD

Contract Value: \$100k

Duration: May 2011

DESCRIPTION

The Electrix Telecommunications Division was successful in being awarded the prestigious installation contract for the new structured data cabling and power reticulation within the then new RMIT - Future Advanced Manufacturing Precinct Building 55.

SCOPE

The data cabling works involved structured data cabling throughout the building over specially constructed tray work originating from the communications room. All cables were then terminated and fully tested on cabinet mounted patch panels. These provided the computer access points and data ports for the newly installed fabrication machines and new automated robotic arm.

Power outlets were supplied and installed by Electrix for all the large machinery as well as student desk computer terminals on the various floors and lecture rooms throughout the building.

Time constraints were very tight for this project with engineers being flown in from around the globe with preset timeslots for commissioning of specialised automation and robotic equipment and with an official opening date for media and government personnel.

VALUE TO CLIENT

The building was officially opened on June 7th 2011 by the Victoria State Premier Ted Baillieu and in the presence of Melbourne dignitaries.

The project was completed on time and within budget.
